Outline

-
- Part 1 Deep learning framework**
 - Part 2 Introduction to Pytorch**
 - Part 3 Use Pytorch to build neural network**
 - Part 4 Tensorboard and FP16 training**
 - Part 5 Non-convex optimizer**
-

Highlights

Learn to build neural network by PyTorch

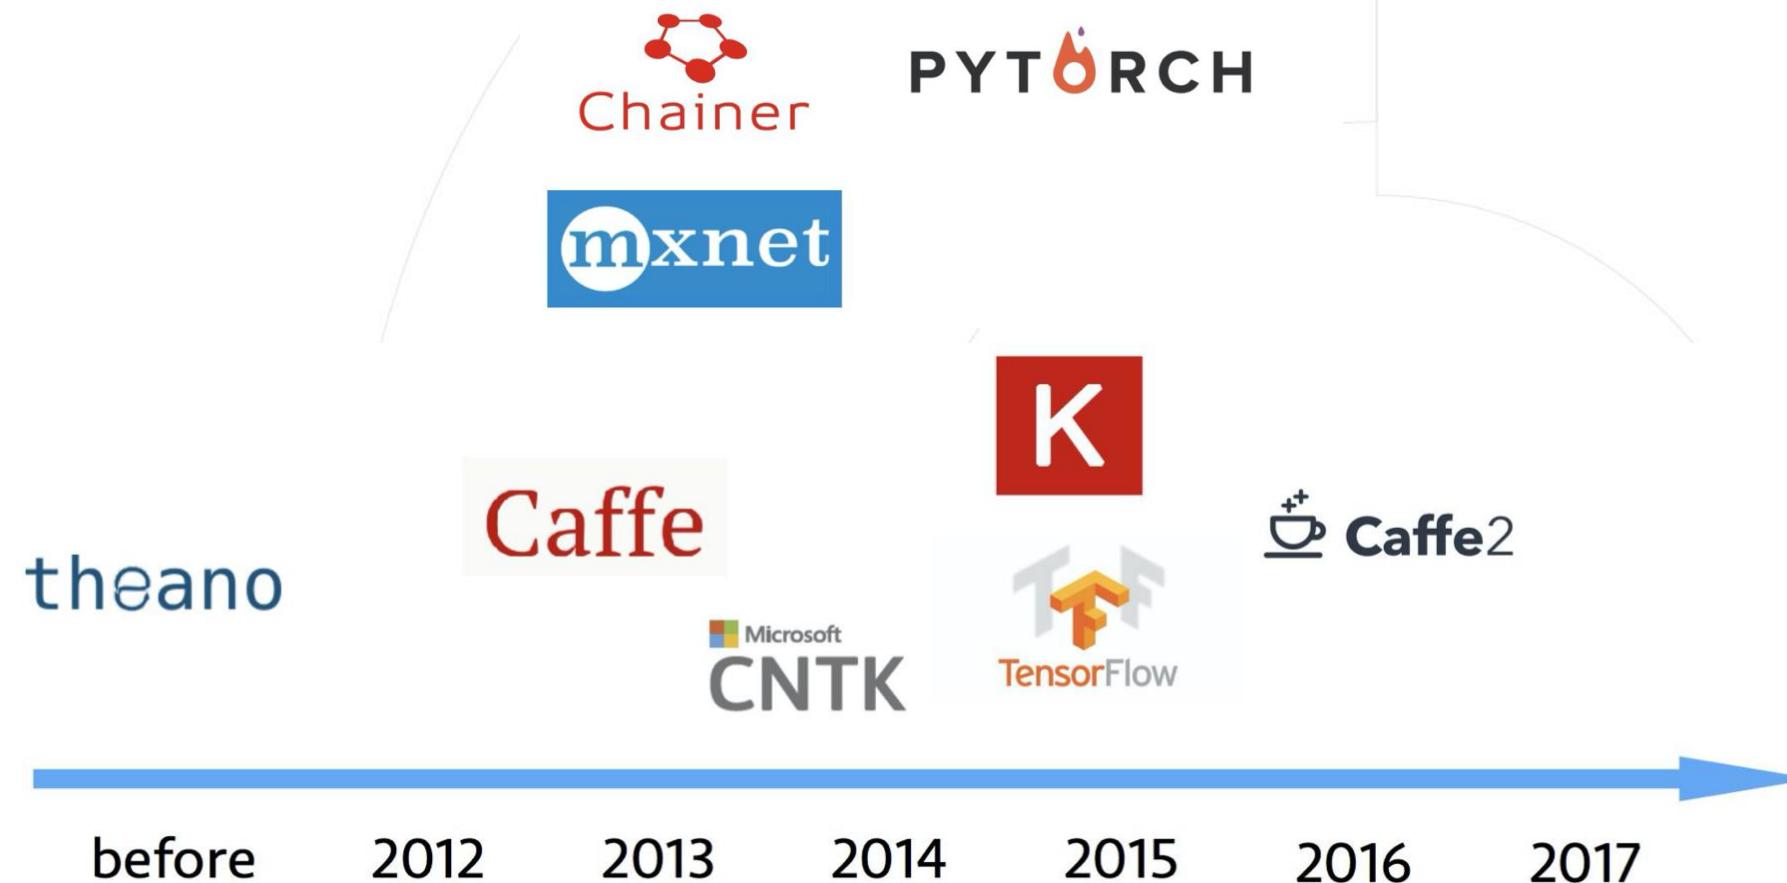

Learn to train a whole network

Learn the features of basic optimizers

Understand the FP16 training and visualization of Tensorboard

Understand the features of different training frameworks

- The history of deep learning framework

- The history of deep learning framework

- **CPU vs GPU**

<https://www.omnisci.com/technical-glossary/cpu-vs-gpu>

<https://ph.news.yahoo.com/nvidia-achieves-massive-increase-ai-013811898.html>

30x Higher Throughput than CPU
Server on Deep Learning Inference

Workload: ResNet-50 | CPU: 2X Xeon E5-2660 v4, 2GHz | GPU: add 1X Tesla P100 or V100 at 150W | V100 measured on pre-production hardware.

- **Static vs Dynamic Graphs**

TensorFlow: Build graph once, then run many times (**static**)

```
N, D, H = 64, 1000, 100
x = tf.placeholder(tf.float32, shape=(N, D))
y = tf.placeholder(tf.float32, shape=(N, D))
w1 = tf.Variable(tf.random_normal((D, H)))
w2 = tf.Variable(tf.random_normal((H, D)))

h = tf.maximum(tf.matmul(x, w1), 0)
y_pred = tf.matmul(h, w2)
diff = y_pred - y
loss = tf.reduce_mean(tf.reduce_sum(diff ** 2, axis=1))
grad_w1, grad_w2 = tf.gradients(loss, [w1, w2])

learning_rate = 1e-5
new_w1 = w1.assign(w1 - learning_rate * grad_w1)
new_w2 = w2.assign(w2 - learning_rate * grad_w2)
updates = tf.group(new_w1, new_w2)

with tf.Session() as sess:
    sess.run(tf.global_variables_initializer())
    values = {x: np.random.randn(N, D),
              y: np.random.randn(N, D),}
    losses = []
    for t in range(50):
        loss_val, _ = sess.run([loss, updates],
                             feed_dict=values)
```

Build graph

} Run each iteration

PyTorch: Each forward pass defines a new graph (**dynamic**)

```
import torch

N, D_in, H, D_out = 64, 1000, 100, 10
x = torch.randn(N, D_in)
y = torch.randn(N, D_out)
w1 = torch.randn(D_in, H, requires_grad=True)
w2 = torch.randn(H, D_out, requires_grad=True)

learning_rate = 1e-6
for t in range(500):
    y_pred = x.mm(w1).clamp(min=0).mm(w2)
    loss = (y_pred - y).pow(2).sum()

    loss.backward()
```

New graph each iteration

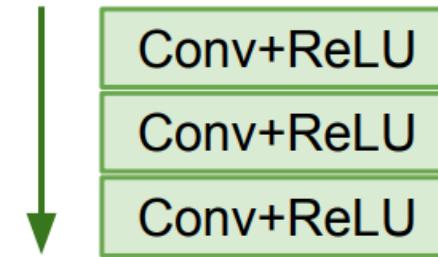

- **Static vs Dynamic: Optimization**

With static graphs,
framework can
optimize the
graph for you
before it runs!

The graph you wrote

Equivalent graph with
fused operations

- **Static vs Dynamic: Conditional**

$$y = \begin{cases} w_1 * x & \text{if } z > 0 \\ w_2 * x & \text{otherwise} \end{cases}$$

PyTorch: Normal Python

```
N, D, H = 3, 4, 5
x = torch.randn(N, D, requires_grad=True)
w1 = torch.randn(D, H)
w2 = torch.randn(D, H)

z = 10
if z > 0:
    y = x.mm(w1)
else:
    y = x.mm(w2)
```

http://cs231n.stanford.edu/slides/2018/cs231n_2018_lecture08.pdf

TensorFlow: Special TF control flow operator!

```
N, D, H = 3, 4, 5
x = tf.placeholder(tf.float32, shape=(N, D))
z = tf.placeholder(tf.float32, shape=None)
w1 = tf.placeholder(tf.float32, shape=(D, H))
w2 = tf.placeholder(tf.float32, shape=(D, H))

def f1(): return tf.matmul(x, w1)
def f2(): return tf.matmul(x, w2)
y = tf.cond(tf.less(z, 0), f1, f2)

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        z: 10,
        w1: np.random.randn(D, H),
        w2: np.random.randn(D, H),
    }
    y_val = sess.run(y, feed_dict=values)
```

Library functions

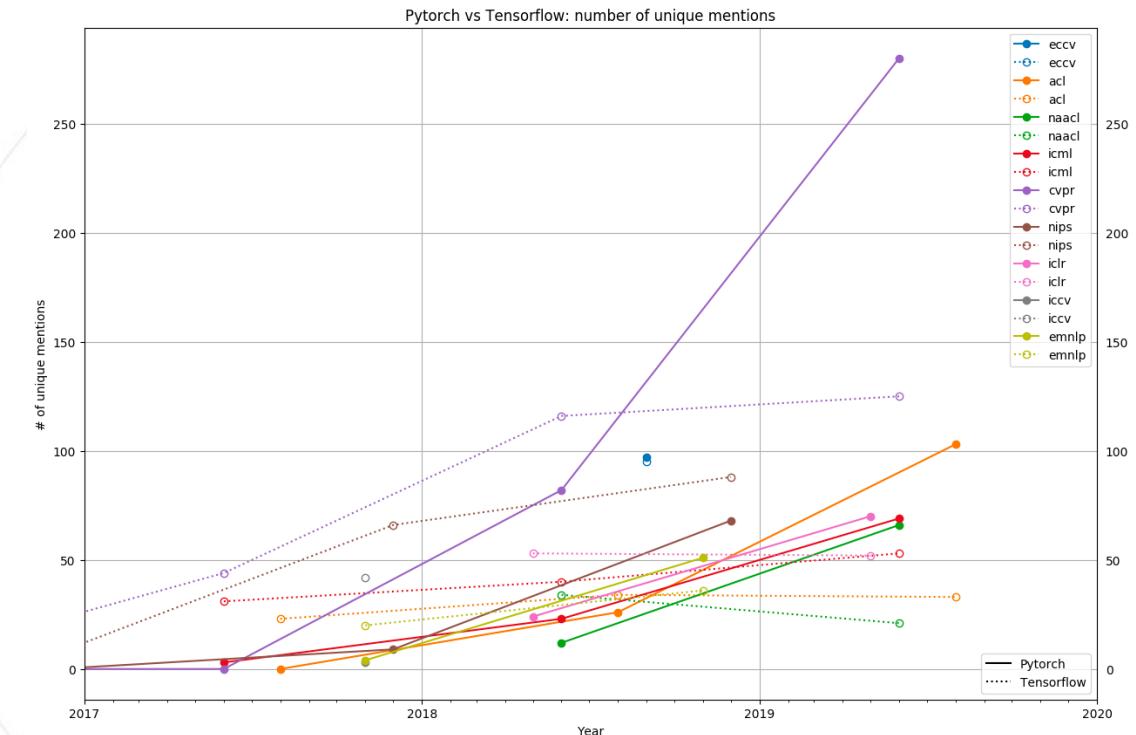

Computational efficiency + GPU support

Auto-differentiation

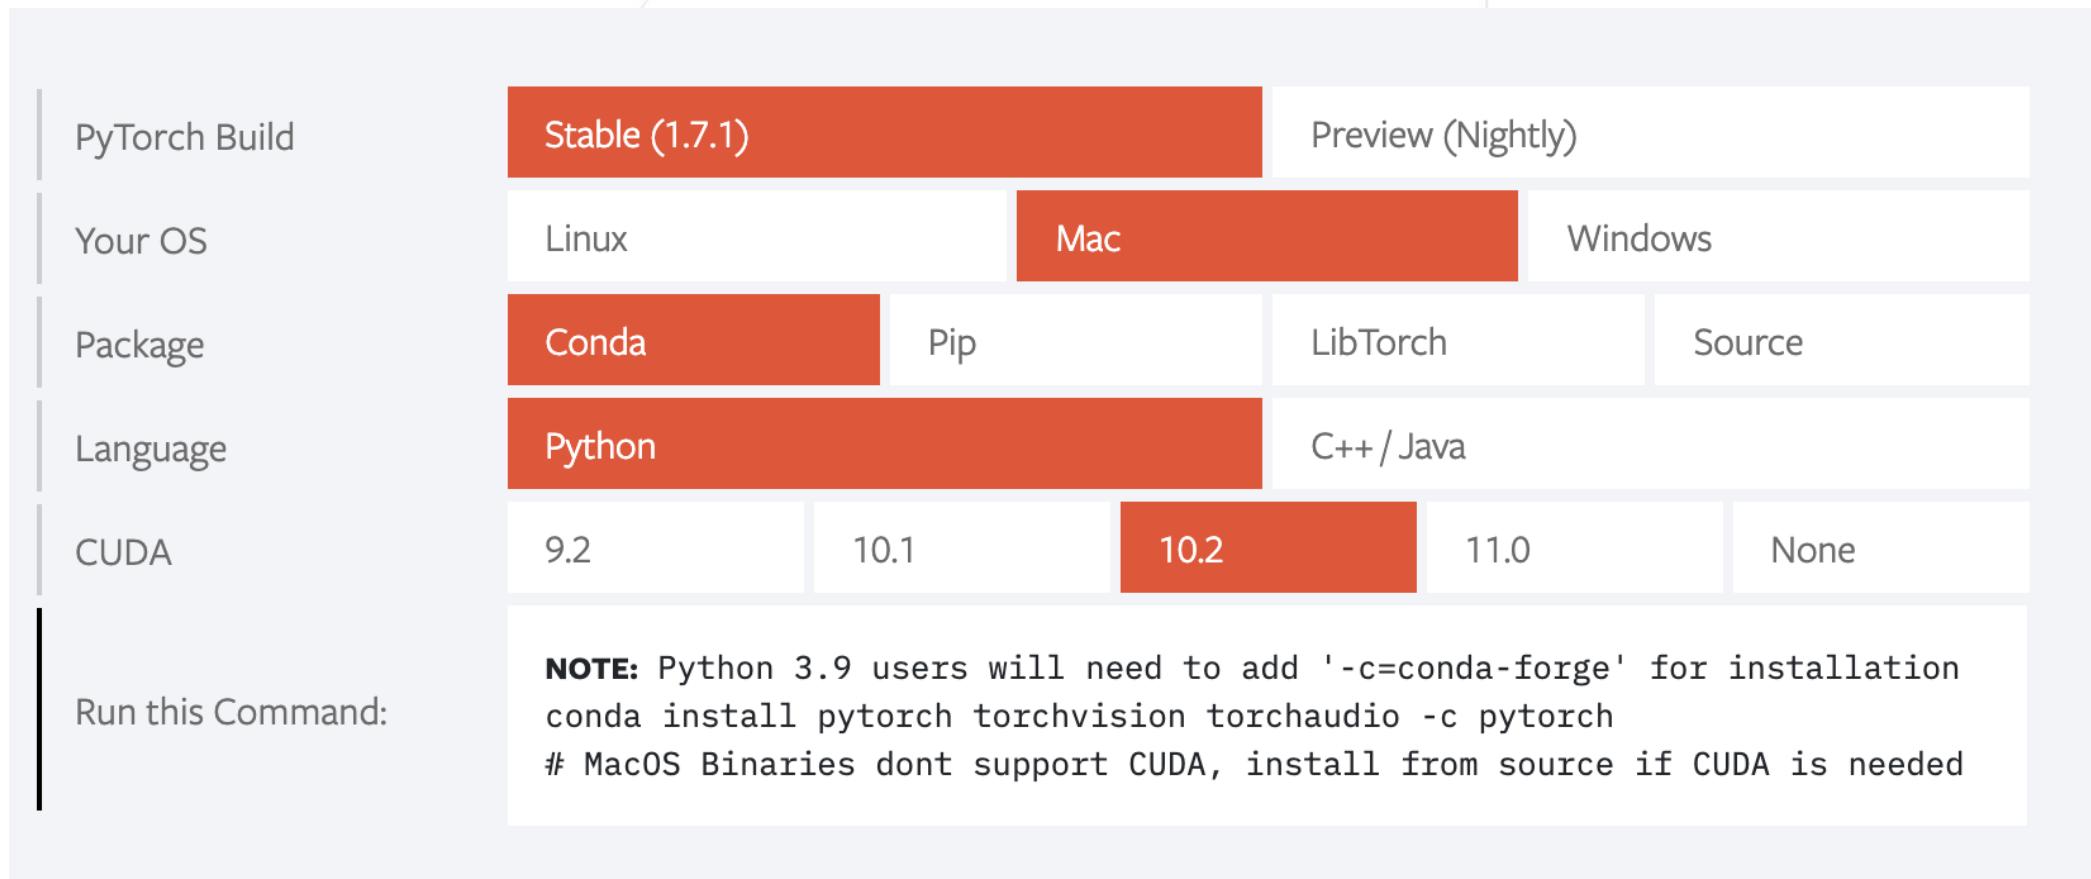

Online community

The most popular framework for academia

<http://bangqu.com/AT8859.html>

• Installing PyTorch

• Pytorch package

Package	Description
torch	The top-level PyTorch package and tensor library.
torch.nn	A subpackage that contains modules and extensible classes for building neural networks.
torch.autograd	A subpackage that supports all the differentiable Tensor operations in PyTorch.
torch.nn.functional	A functional interface that contains typical operations used for building neural networks like loss functions, activation functions, and convolution operations.
torch.optim	A subpackage that contains standard optimization operations like SGD and Adam.
torch.utils	A subpackage that contains utility classes like data sets and data loaders that make data preprocessing easier.
torchvision	A package that provides access to popular datasets, model architectures, and image transformations for computer vision.

• Pytorch Tensors

```
import numpy as np
import cudamat as cm
import torch

n, p = int(2e3), int(40e3)
A = np.random.randn(n, p)
B = np.random.randn(p, n)
%timeit A @ B
```

916 ms ± 45.8 ms per loop
(numpy + cpu)

```
cm.cUBLAS_init()
cm.CUDAMatrix.init_random()
A_cm = cm.empty((n, p)).fill_with_randn()
B_cm = cm.empty((p, n)).fill_with_randn()
%timeit A_cm.dot(B_cm)
cm.cUBLAS_shutdown()
```

26.6 ms ± 721 µs per loop
(numpy+gpu)

```
A= torch.rand(n,p).cuda()
B= torch.rand(p,n).cuda()
%timeit torch.mm(A,B)
```

26.8 ms ± 545 µs per loop
(torch+gpu)

• Pytorch Tensors

Tensor Initialization

Directly from data

```
data = [[1, 2], [3, 4]]  
x_data = torch.tensor(data)
```

From a NumPy array

```
np_array = np.array(data)  
x_np = torch.from_numpy(np_array)
```

<https://pytorch.org/tutorials/>

From another tensor:

```
x_ones = torch.ones_like(x_data) # retains the properties of x_data  
print(f"Ones Tensor: \n {x_ones} \n")  
  
x_rand = torch.rand_like(x_data, dtype=torch.float) # overrides the datatype of x_data  
print(f"Random Tensor: \n {x_rand} \n")
```

```
Ones Tensor:  
tensor([[1, 1],  
       [1, 1]])  
  
Random Tensor:  
tensor([[0.2143, 0.8153],  
       [0.5212, 0.8607]])
```

With random or constant values

```
shape = (2,3,)  
rand_tensor = torch.rand(shape)  
ones_tensor = torch.ones(shape)  
zeros_tensor = torch.zeros(shape)
```

• Tensor Operations

Moving to GPU

```
if torch.cuda.is_available():
    tensor = tensor.to('cuda')
```

Standard numpy-like indexing and slicing:

```
tensor = torch.ones(4, 4)
tensor[:, 1] = 0
print(tensor)
```

```
tensor([[1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.]])
```

<https://pytorch.org/tutorials/>

Multiplying tensors

```
print(f"tensor.mul(tensor) \n {tensor.mul(tensor)} \n")
# Alternative syntax:
print(f"tensor * tensor \n {tensor * tensor}")
```

```
tensor.mul(tensor)
tensor([[1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.]])
```

```
tensor *
tensor([[1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.]])
```

In-place operations

```
print(tensor, "\n")
tensor.add_(5)
print(tensor)
```

```
tensor([[1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.],
       [1., 0., 1., 1.]])
```

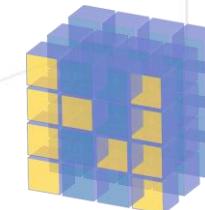

```
tensor([[6., 5., 6., 6.],
       [6., 5., 6., 6.],
       [6., 5., 6., 6.],
       [6., 5., 6., 6.]])
```

- The NumPy Bridge – Arrays And Tensors

Tensor to NumPy array

```
t = torch.ones(5)
print(f"t: {t}")
n = t.numpy()
print(f"n: {n}")
```

```
t: tensor([1., 1., 1., 1., 1.])
n: [1. 1. 1. 1. 1.]
```

NumPy

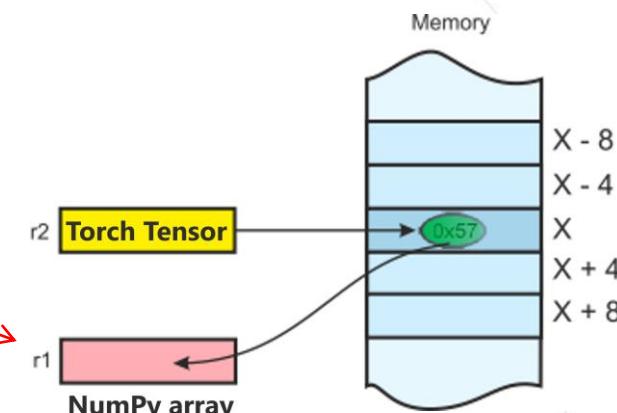

```
t.add_(1)
print(f"t: {t}")
print(f"n: {n}")
```

```
t: tensor([2., 2., 2., 2., 2.])
n: [2. 2. 2. 2. 2.]
```

Tensor to NumPy array

```
n = np.ones(5)
t = torch.from_numpy(n)
```

*share their underlying
memory*

• Pytorch Autograd

```
import torch

a = torch.tensor([2., 3.], requires_grad=True)
b = torch.tensor([6., 4.], requires_grad=True)
```

$$Q = 3a^3 - b^2$$

$$Q = 3a^{**}3 - b^{**2}$$

$$\frac{\partial Q}{\partial a} = 9a^2$$

```
external_grad = torch.tensor([1., 1.])
Q.backward(gradient=external_grad)
```

$$\frac{\partial Q}{\partial b} = -2b$$

```
print(9*a**2 == a.grad) tensor([True, True])
print(-2*b == b.grad) tensor([True, True])
```

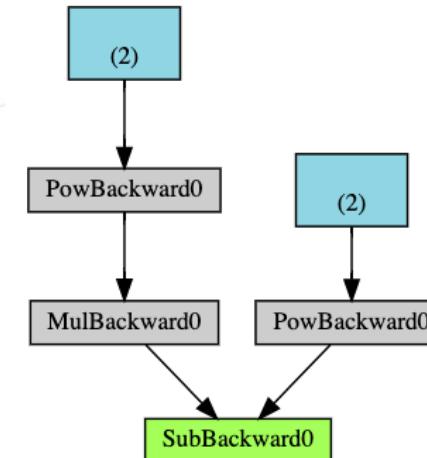

Autograd forward pass

Run the requested operation to compute a resulting tensor, and

Maintain the operation's gradient function in the directed acyclic graph

<https://pytorch.org/tutorials/>

Computational Graph

Autograd backward pass

Computes the gradients from each .grad_fn

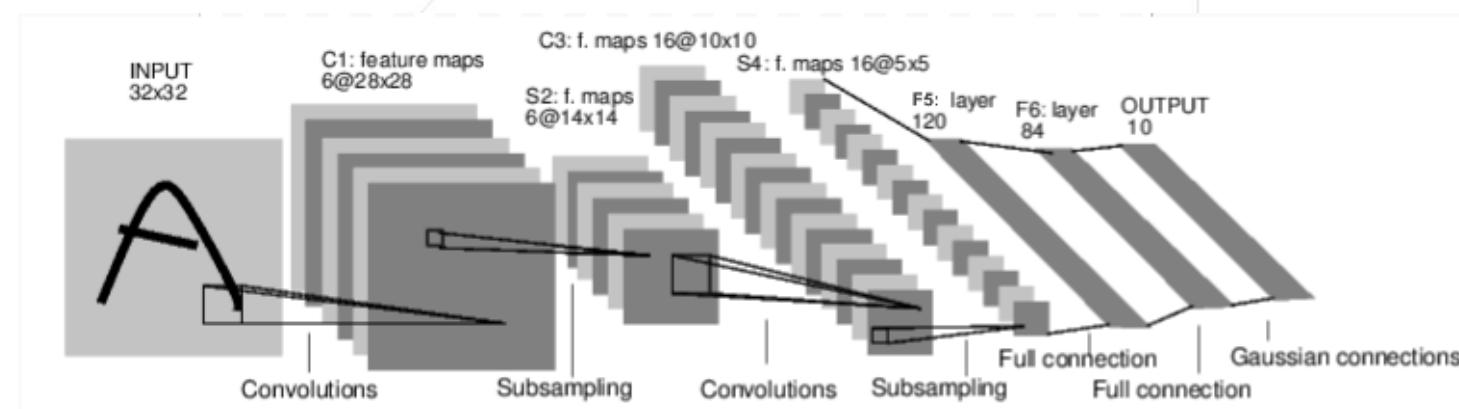

Accumulates them in the respective tensors .grad attribute, and

Using the chain rule, propagates all the way to the leaf tensors.

Outline

-
- Part 1 Deep learning framework**
 - Part 2 Introduction to Pytorch**
 - Part 3 Use Pytorch to build neural network**
 - Part 4 Tensorboard and FP16 training**
 - Part 5 Non-convex optimizer**
-

- Overview

A typical training procedure for a neural network is as follows:

- Define the neural network that has some learnable parameters (or weights)
- Iterate over a dataset of inputs
- Process input through the network
- Compute the loss (how far is the output from being correct)
- Propagate gradients back into the network's parameters
- Update the weights of the network, typically using a simple update rule: $weight = weight - learning_rate * gradient$

Use Pytorch to build neural network

- Define the network

```
import torch
import torch.nn as nn
import torch.nn.functional as F

class Net(nn.Module):

    def __init__(self):
        super(Net, self).__init__()
        # 1 input image channel, 6 output channels, 3x3 square convolution
        # kernel
        self.conv1 = nn.Conv2d(1, 6, 3)
        self.conv2 = nn.Conv2d(6, 16, 3)
        # an affine operation: y = Wx + b
        self.fc1 = nn.Linear(16 * 6 * 6, 120) # 6*6 from image dimension
        self.fc2 = nn.Linear(120, 84)
        self.fc3 = nn.Linear(84, 10)

    def forward(self, x):
        # Max pooling over a (2, 2) window
        x = F.max_pool2d(F.relu(self.conv1(x)), (2, 2))
        # If the size is a square you can only specify a single number
        x = F.max_pool2d(F.relu(self.conv2(x)), 2)
        x = x.view(-1, self.num_flat_features(x))
        x = F.relu(self.fc1(x))
        x = F.relu(self.fc2(x))
        x = self.fc3(x)
        return x

    def num_flat_features(self, x):
        size = x.size()[1:] # all dimensions except the batch dimension
        num_features = 1
        for s in size:
            num_features *= s
        return num_features

net = Net()
print(net)
```

```
Net(
  (conv1): Conv2d(1, 6, kernel_size=(3, 3), stride=(1, 1))
  (conv2): Conv2d(6, 16, kernel_size=(3, 3), stride=(1, 1))
  (fc1): Linear(in_features=576, out_features=120, bias=True)
  (fc2): Linear(in_features=120, out_features=84, bias=True)
  (fc3): Linear(in_features=84, out_features=10, bias=True)
)
```

```
input = torch.randn(1, 1, 32, 32)
out = net(input)
print(out)
```

```
tensor([[ 0.1002, -0.0694, -0.0436,  0.0103,  0.0488, -0.0429, -0.0941, -0.0146,
         -0.0031, -0.0923]], grad_fn=<AddmmBackward>)
```

- Define the loss function

```
criterion = nn.MSELoss()  
  
loss = criterion(output, target)  
print(loss)
```

```
tensor(0.4969, grad_fn=<MseLossBackward>)
```

- Backprop

```
net.zero_grad()           # zeroes the gradient buffers of all parameters  
  
print('conv1.bias.grad before backward')  
print(net.conv1.bias.grad)  
  
loss.backward()  
  
print('conv1.bias.grad after backward')  
print(net.conv1.bias.grad)
```

```
conv1.bias.grad before backward  
tensor([0., 0., 0., 0., 0., 0.])  
conv1.bias.grad after backward  
tensor([ 0.0111, -0.0064,  0.0053, -0.0047,  0.0026, -0.0153])
```

```
weight = weight - learning_rate * gradient
```

- Update the weights-naive

```
learning_rate = 0.01  
for f in net.parameters():  
    f.data.sub_(f.grad.data * learning_rate)
```

- Update the weights-torch.optim

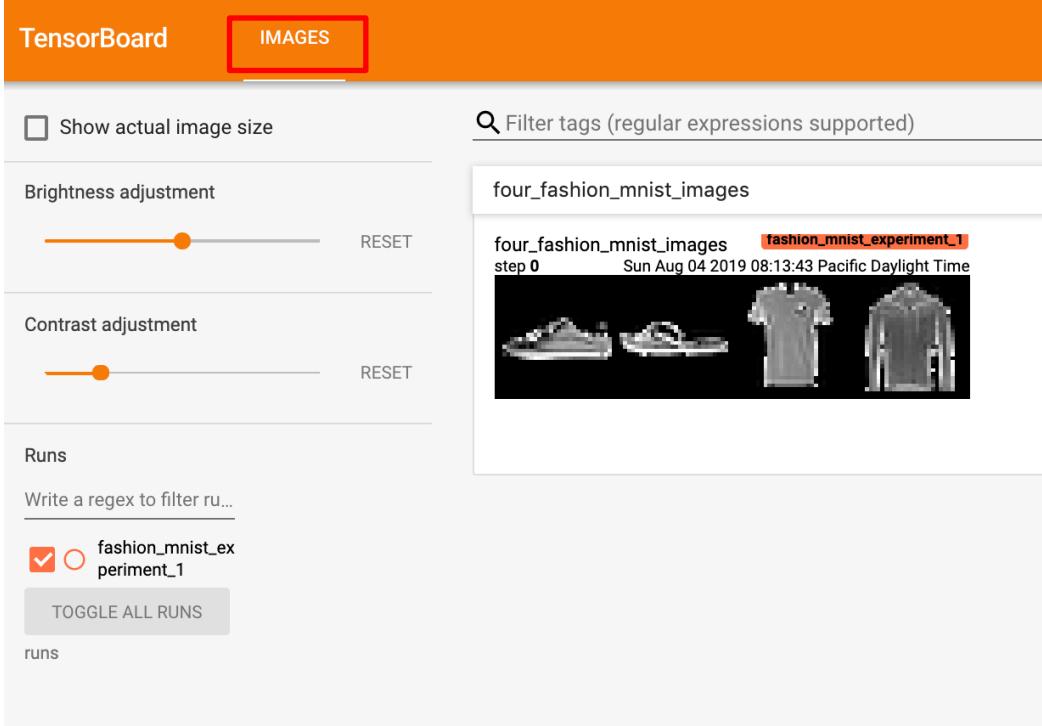

```
import torch.optim as optim  
  
# create your optimizer  
optimizer = optim.SGD(net.parameters(), lr=0.01)  
  
# in your training loop:  
optimizer.zero_grad()        # zero the gradient buffers  
output = net(input)  
loss = criterion(output, target)  
loss.backward()  
optimizer.step()             # Does the update
```

Outline

-

```

- Mixed-precision training

combined single-precision (FP32)
with half-precision (e.g. FP16)

- Shorter training time
- Lower memory requirements, enabling larger batch sizes, larger models, or larger inputs.

```
import torch
# Creates once at the beginning of training
scaler = torch.cuda.amp.GradScaler()

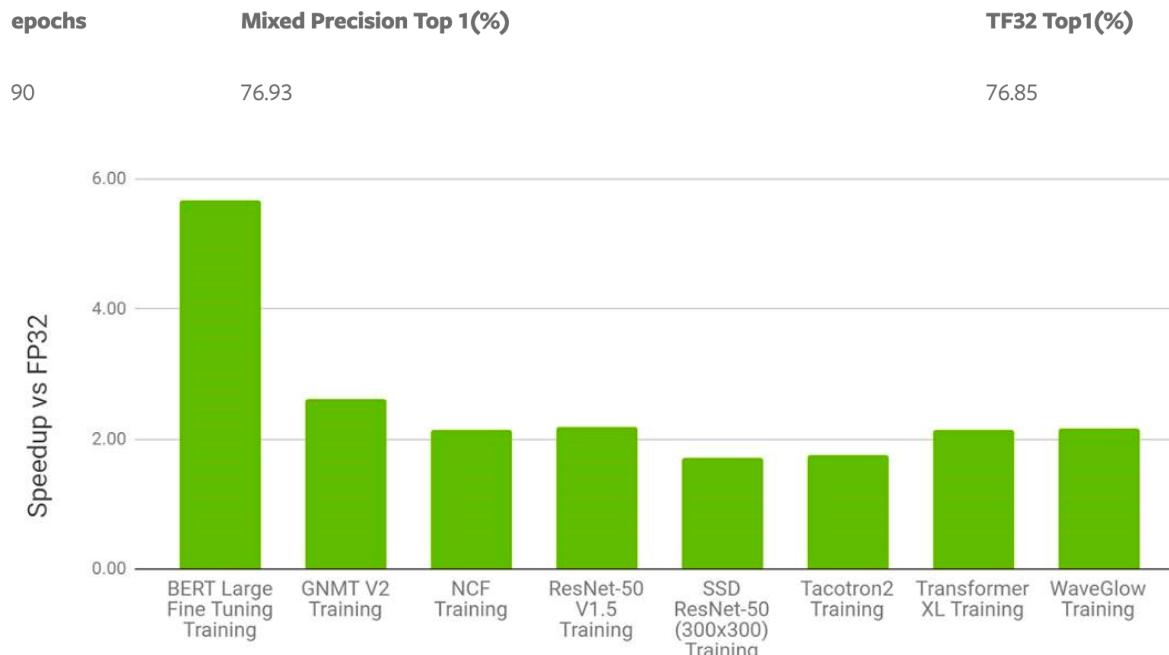

for data, label in data_iter:
    optimizer.zero_grad()
    # Casts operations to mixed precision
    with torch.cuda.amp.autocast():
        loss = model(data)

    # Scales the loss, and calls backward()
    # to create scaled gradients
    scaler.scale(loss).backward()

    # Unscales gradients and calls
    # or skips optimizer.step()
    scaler.step(optimizer)

    # Updates the scale for next iteration
    scaler.update()
```

Training accuracy: NVIDIA DGX A100 (8x A100 40GB)

FP16 on NVIDIA V100 vs. FP32 on V100

Outline

-
- Part 1 Deep learning framework**
 - Part 2 Introduction to Pytorch**
 - Part 3 Use Pytorch to build neural network**
 - Part 4 Tensorboard and FP16 training**
 - Part 5 Non-convex optimizer**
-

- **Gradient Descent**

- Batch gradient descent

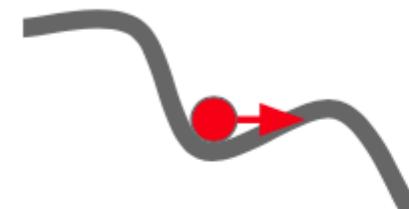

$$x = x - \eta \nabla_x J(x)$$

- Stochastic gradient descent

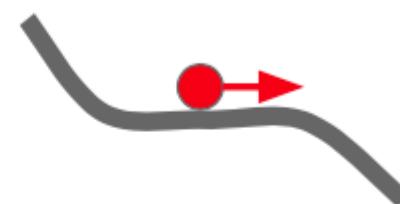

$$x = x - \eta \nabla_x J(x; I^{(i:i+n)}; y^{(i:i+n)})$$

- SGD
- Considering two cases:
 - the local loss landscape is a smooth hill
 - may take a long time to reach the bottom
 - the local loss landscape is a steep ravine
 - may oscillate back and forth near the bottom

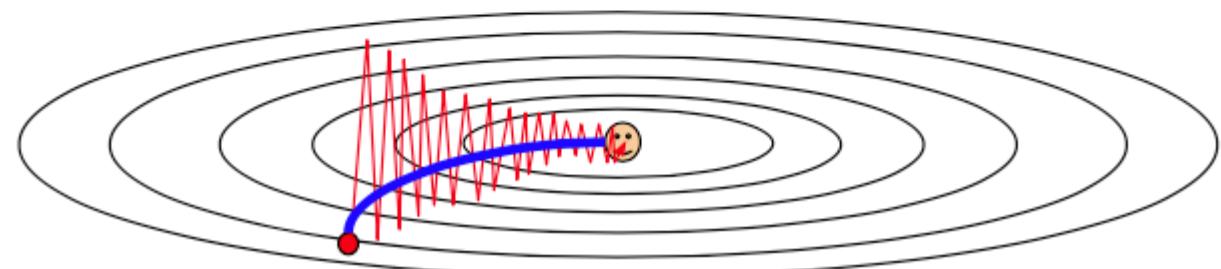

Local Minima

Saddle points

Poor Conditioning

- SGD + momentum

SGD

$$x_{t+1} = x_t - \alpha \nabla f(x_t)$$

```
while True:  
    dx = compute_gradient(x)  
    x -= learning_rate * dx
```

SGD + Momentum

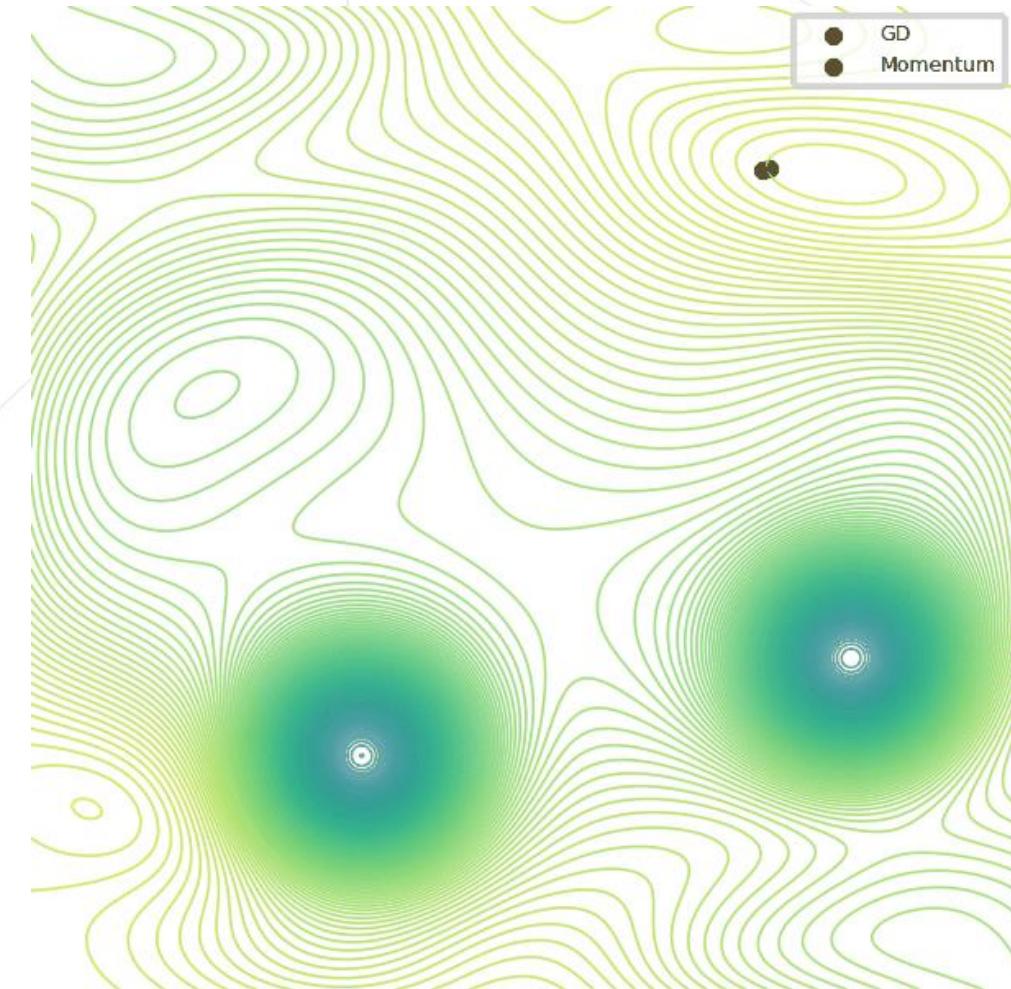

$$v_{t+1} = \rho v_t + \nabla f(x_t)$$

$$x_{t+1} = x_+ - \alpha v_{t+1}$$

```
vx = 0  
while True:  
    dx = compute_gradient(x)  
    vx = rho * vx + dx  
    x -= learning_rate * vx
```

Sutskever I, Martens J, Dahl G, et al. On the importance of initialization and momentum in deep learning. ICML, 2013.

- **SGD + momentum**
- momentum term
 - increases for dimensions whose gradients point in the same directions
 - reduces updates for dimensions whose gradients change directions

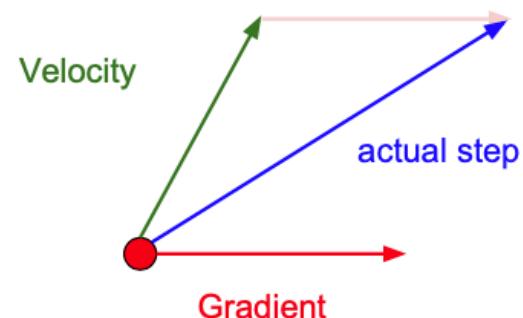

- **SGD + momentum**

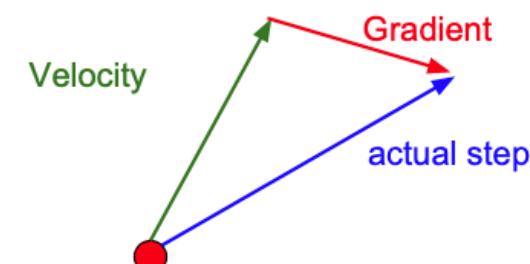

- We'd like momentum term has a notion of where it is going
- It may slow down when a local minimum is near

- **Nesterov momentum**

Momentum update:

Nesterov Momentum

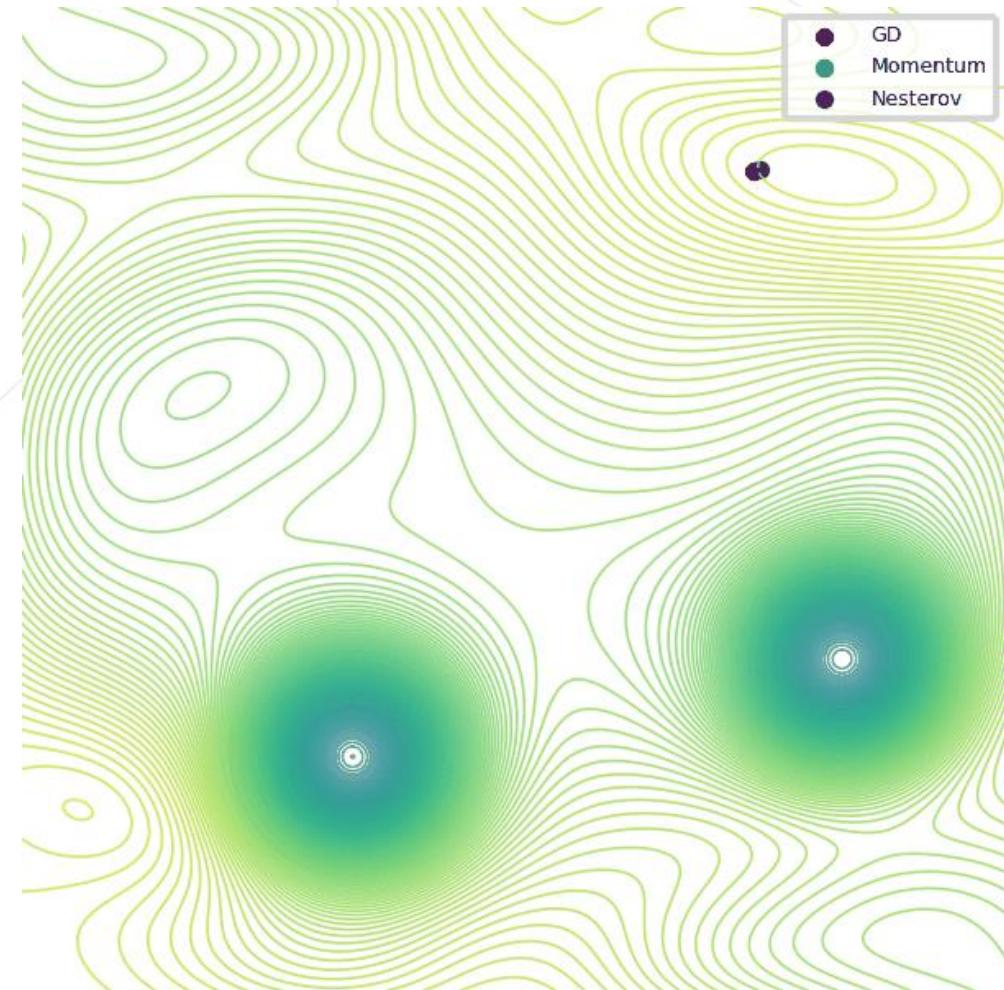

- **Nesterov momentum**

- Look ahead by calculating the gradient at the approximate future position of the parameters instead of current ones

$$v_{t+1} = \rho v_t - \alpha \nabla f(\tilde{x}_t)$$

$$\begin{aligned}\tilde{x}_{t+1} &= \tilde{x}_t - \rho v_t + (1 + \rho)v_{t+1} \\ &= \tilde{x}_t + v_t + \rho(v_t - v_{t-1})\end{aligned}$$

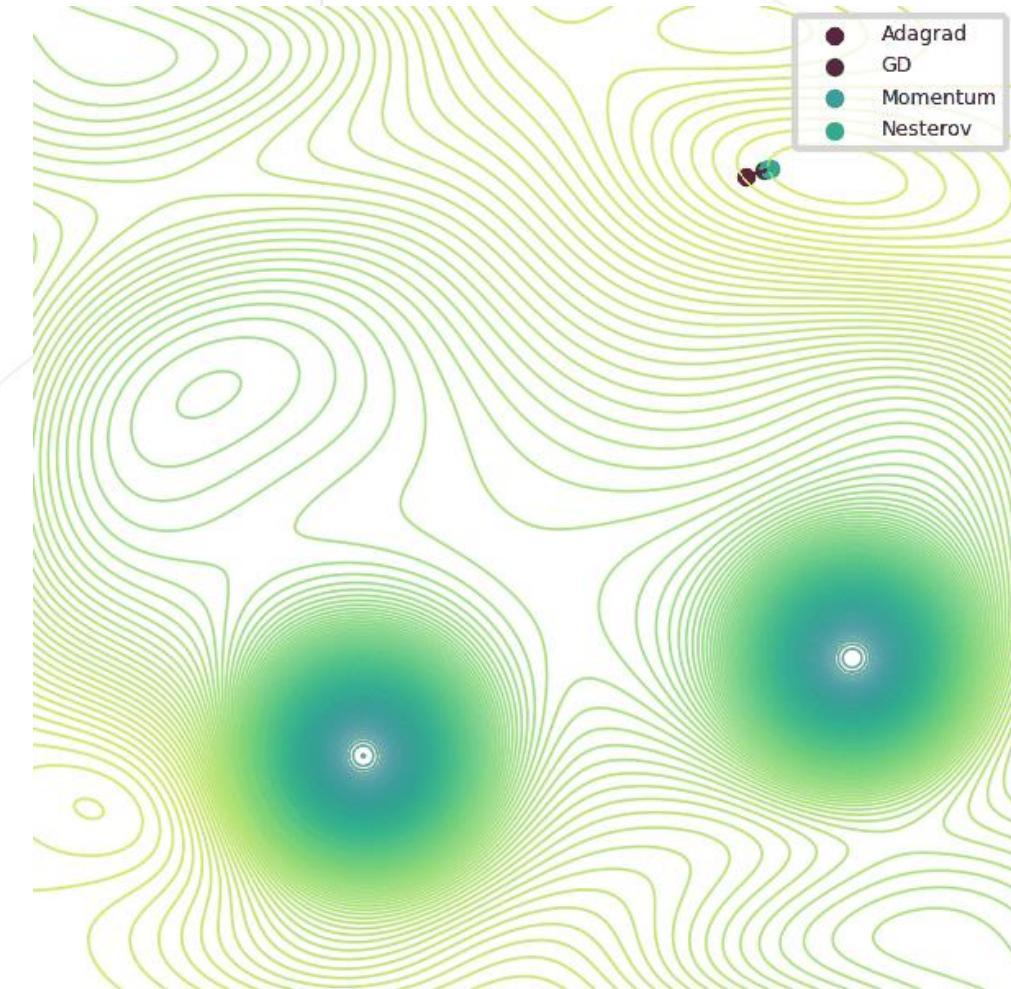

- **SGD + momentum**
 - Choosing a proper learning rate can be difficult.
 - The same learning rate applies to all parameter updates
- **AdaGrad**

$$\theta_{t+1} = \theta_t - \frac{\eta}{\sqrt{G_t + \epsilon}} \odot g_t.$$

```
grad_squared = 0
while True:
    dx = compute_gradient(x)
    grad_squared += dx * dx
    x -= learning_rate * dx / (np.sqrt(grad_squared) + 1e-7)
```

Duchi J, Hazan E, Singer Y. Adaptive Subgradient Methods for Online Learning and Stochastic Optimization. JMLR, 2011.

- **AdaGrad**
- Gradient-based optimization
 - Smaller learning rates for frequently occurring features
 - Higher learning rates for parameters associated with infrequent features

Duchi J, Hazan E, Singer Y. Adaptive Subgradient Methods for Online Learning and Stochastic Optimization. JMLR, 2011.

- **RMSProp**

- AdaGrad + momentum

AdaGrad

```
grad_squared = 0
while True:
    dx = compute_gradient(x)
    grad_squared += dx * dx
    x -= learning_rate * dx / (np.sqrt(grad_squared) + 1e-7)
```

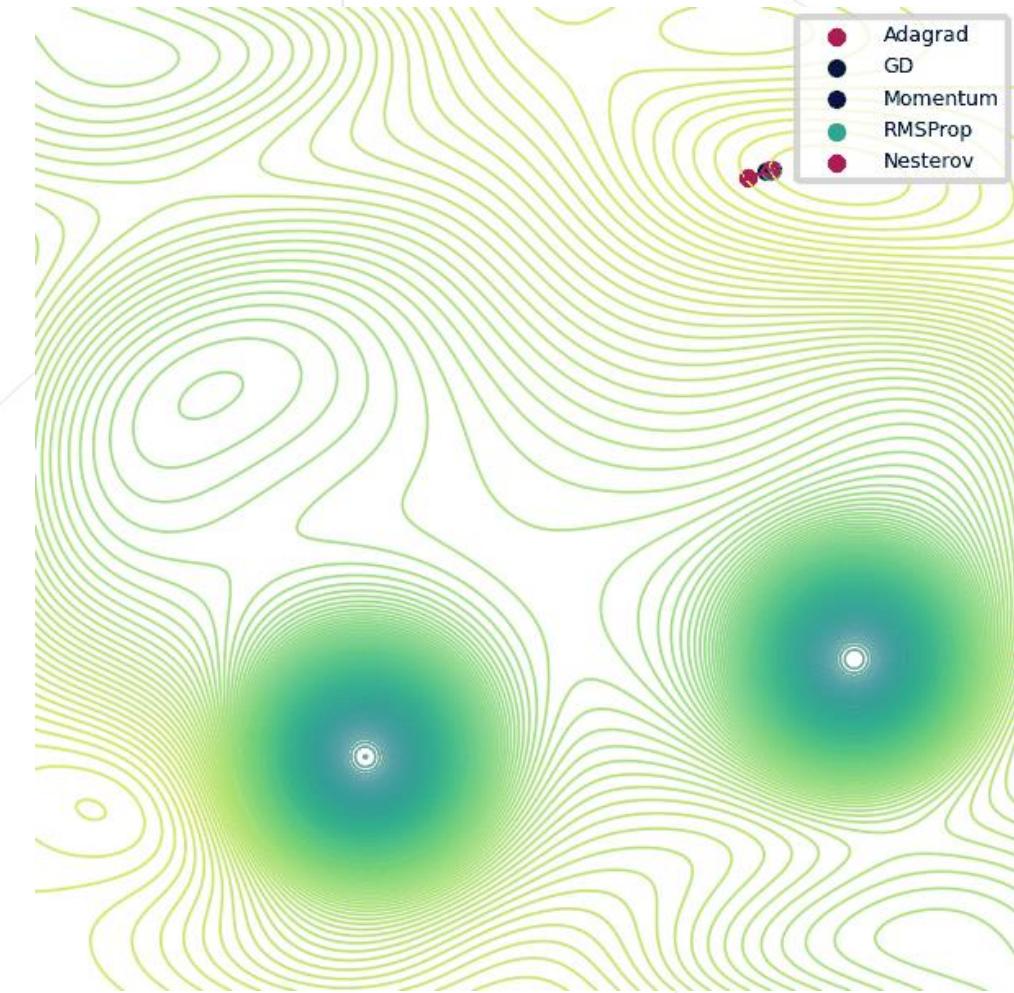

RMSProp

```
grad_squared = 0
while True:
    dx = compute_gradient(x)
    grad_squared = decay_rate * grad_squared + (1 - decay_rate) * dx * dx
    x -= learning_rate * dx / (np.sqrt(grad_squared) + 1e-7)
```

- **RMSProp**
 - AdaGrad + momentum

$$E[g^2]_t = 0.9E[g^2]_{t-1} + 0.1g_t^2$$
$$\theta_{t+1} = \theta_t - \frac{\eta}{\sqrt{E[g^2]_t + \epsilon}} g_t$$

Tieleman and Hinton, 2012

- **Adam**

- momentum: a ball running down a slope
- Adam: a heavy ball with friction
 - prefers flat minima in the error surface

```
first_moment = 0
second_moment = 0
for t in range(1, num_iterations):
    dx = compute_gradient(x)
    first_moment = beta1 * first_moment + (1 - beta1) * dx
    second_moment = beta2 * second_moment + (1 - beta2) * dx * dx
    first_unbias = first_moment / (1 - beta1 ** t)
    second_unbias = second_moment / (1 - beta2 ** t)
    x -= learning_rate * first_unbias / (np.sqrt(second_unbias) + 1e-7)
```

Momentum

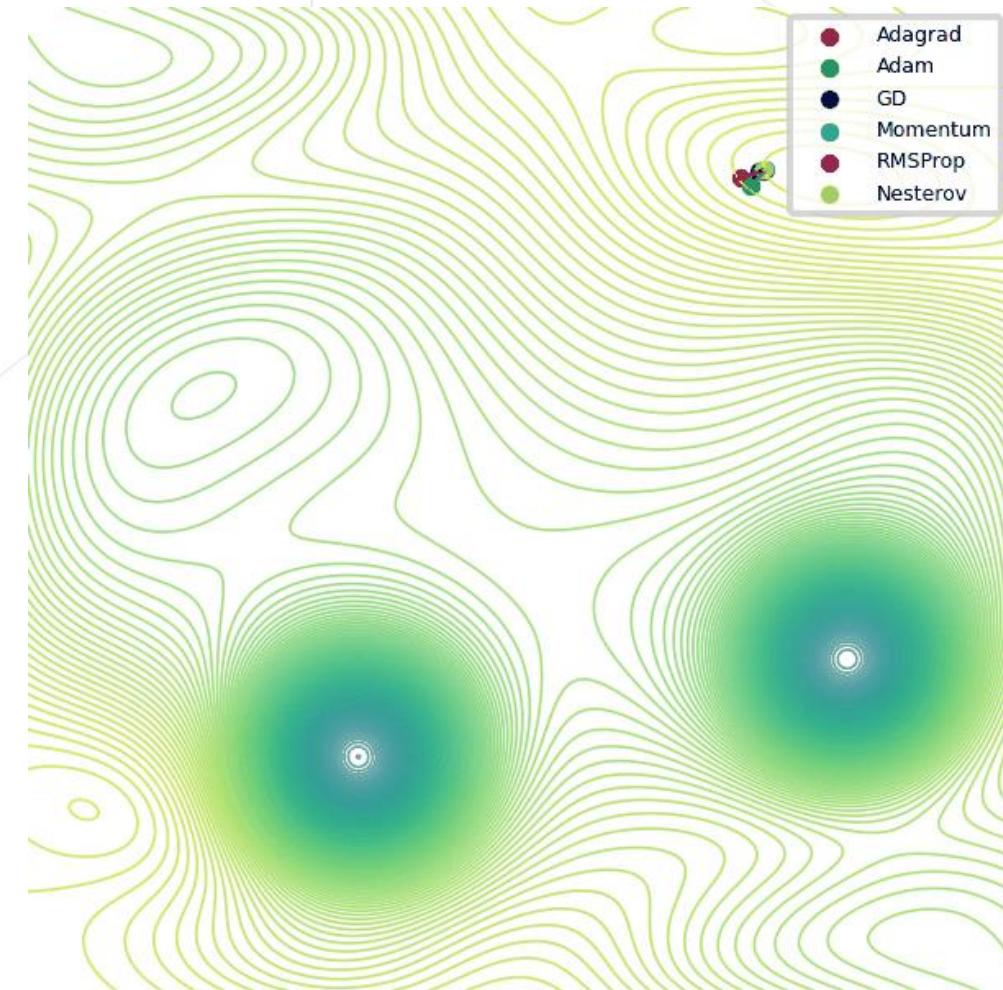

Bias correction

AdaGrad / RMSProp

- **Adam**

- momentum: a ball running down a slope
- Adam: a heavy ball with friction
 - prefers flat minima in the error surface

$$\theta_{t+1} = \theta_t - \frac{\eta}{\sqrt{\hat{v}_t + \epsilon}} \hat{m}_t.$$

Kingma D, Ba J. Adam: A Method for Stochastic Optimization. ICLR, 2015.

- **Adam + Weight decay**

- Weight decay is a technique in training neural networks

$$g_t = \nabla f(\theta_t) + w_t \theta_t,$$

- **AdamW**

- adjusts the weight decay term to appear in the gradient update
- small details can make a noticeable difference

$$\theta_{t+1,i} = \theta_{t,i} - \eta \left(\frac{1}{\sqrt{\hat{\mathcal{E}}_{t+1,i}^{gog} + \epsilon}} \cdot \mathcal{E}_{t+1,i}^g + w_{t,i} \theta_{t,i} \right),$$

Kingma D, Ba J. Adam: A Method for Stochastic Optimization. ICLR, 2015.

- **Which one to choose?**
- Case 1: Little budge to hyperparameter tuning?
Adam, AdamW, Demon Adam ...
- Case 2: Best performance?
SGD + Momentum
