

## Chapter 2 - Section 8

# Recap and Image Segmentation

Dr. Li Hongyang

Friday, April 9, 2021

Partial credit by : Wang Cheng

# Outline

**Part 1**      **Recap: classification loss and detection pipeline**

---

**Part 2**      **Image segmentation**

---

**Part 3**      **Building up your research career**

---

- Classification Loss

- Cross entropy or MSE?

For MSE loss, we have

$$L_{mse,i} = \frac{1}{2}(y_i - p_i)^2$$

$p_i = \sigma(Wx + b)$  函数 $\sigma(\cdot)$ 是 Sigmoid 函数

The grad for MSE loss is:  $\partial L_{mse,i} / \partial W = (y_i - p_i)p_i(1 - p_i)x$

- $Wx+b$  could be very large/small in the first few iterations; since parameters are randomly initialized.
- Gradient vanishing!

- Classification Loss

- Cross entropy or MSE?

For Cross entropy loss, we have

$$L_{ce,i} = -[y_i \log(p_i) + (1 - y_i) \log(1 - p_i)] \quad \longleftrightarrow \quad L_{ce,i} = \begin{cases} -\log(p_i), & y_i = 1 \\ -\log(1 - p_i), & y_i = 0 \end{cases}$$

Equivalent

The grad for CE loss is:  $\partial L_{ce,i} / \partial W = -(y_i - p_i)x$

- Gradient vanishing! **resolved**

- Classification Loss

- Cross entropy or MSE?

Multi-classification CE loss:

$$p_{i,k} = \exp(q_{i,k}) / \sum_j^M \exp(q_{i,j})$$

$$L = \sum_i^N L_{ce,i} = - \sum_i^N \sum_j^M y_{i,j} \log(p_{i,j})$$

**Further extension:**

From cross entropy loss to Focal loss and Circle loss  
What's the relationship?

- Background

- Consistency Regularization

$$\|p_{\text{model}}(y | \text{Augment}(x); \theta) - p_{\text{model}}(y | \text{Augment}(x); \theta)\|_2^2$$

模型在无标签数据 **增广前**和 **增广后**的预测应该一致

- Entropy Minimization

- Minimizes the entropy of  $p_{\text{model}}(y|x; \theta)$

要求分类器对无标签样本输出熵较少的结果

- Traditional Regularization

加入一些常量干扰，使得模型难以记住训练样本，来达到泛化要求

- **Mixup**: Beyond Empirical Risk Minimization (经验风险最小化; 训练误差越小越好)
  - A simple and data-agnostic data augmentation method

$$\tilde{x} = \lambda x_i + (1 - \lambda)x_j, \quad \text{where } x_i, x_j \text{ are raw input vectors}$$
$$\tilde{y} = \lambda y_i + (1 - \lambda)y_j, \quad \text{where } y_i, y_j \text{ are one-hot label encodings}$$

```
# y1, y2 should be one-hot vectors
for (x1, y1), (x2, y2) in zip(loader1, loader2):
    lam = numpy.random.beta(alpha, alpha)
    x = Variable(lam * x1 + (1. - lam) * x2)
    y = Variable(lam * y1 + (1. - lam) * y2)
    optimizer.zero_grad()
    loss(net(x), y).backward()
    optimizer.step()
```

(a) One epoch of *mixup* training in PyTorch.

(b) Effect of *mixup* ( $\alpha = 1$ ) on a toy problem. Green: Class 0. Orange: Class 1. Blue shading indicates  $p(y = 1|x)$ .

- mixup: Beyond Empirical Risk Minimization
  - Why use beta distribution?
  - Similar to label smooth?
  - Why mixup works? (Generalization gap between training data and real data)

<https://www.zhihu.com/question/67472285>

## 如何评价mixup: BEYOND EMPIRICAL RISK MINIMIZATION?

这篇paper是ICLR2018的投稿，直接对raw data和 label interpolation，在很多数据集上取得了SoTA。arxiv.org/pdf/1710.0941...

- mixup: Beyond Empirical Risk Minimization

## *Further reading*

- MixMatch
- ReMixMatch
- FixMatch

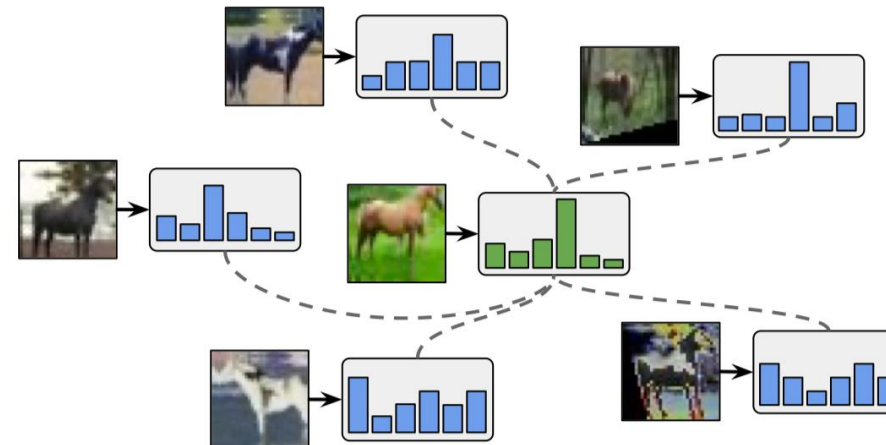

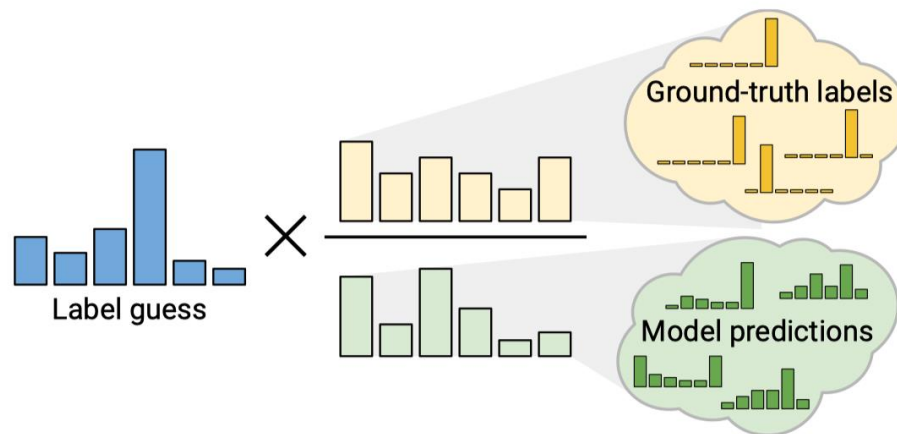

- MixMatch: A Holistic Approach to Semi-Supervised Learning
  - Stochastic data augmentation is applied to an unlabeled image  $K$  times
  - The average of these  $K$  predictions is “sharpened” by adjusting the distribution’s temperature

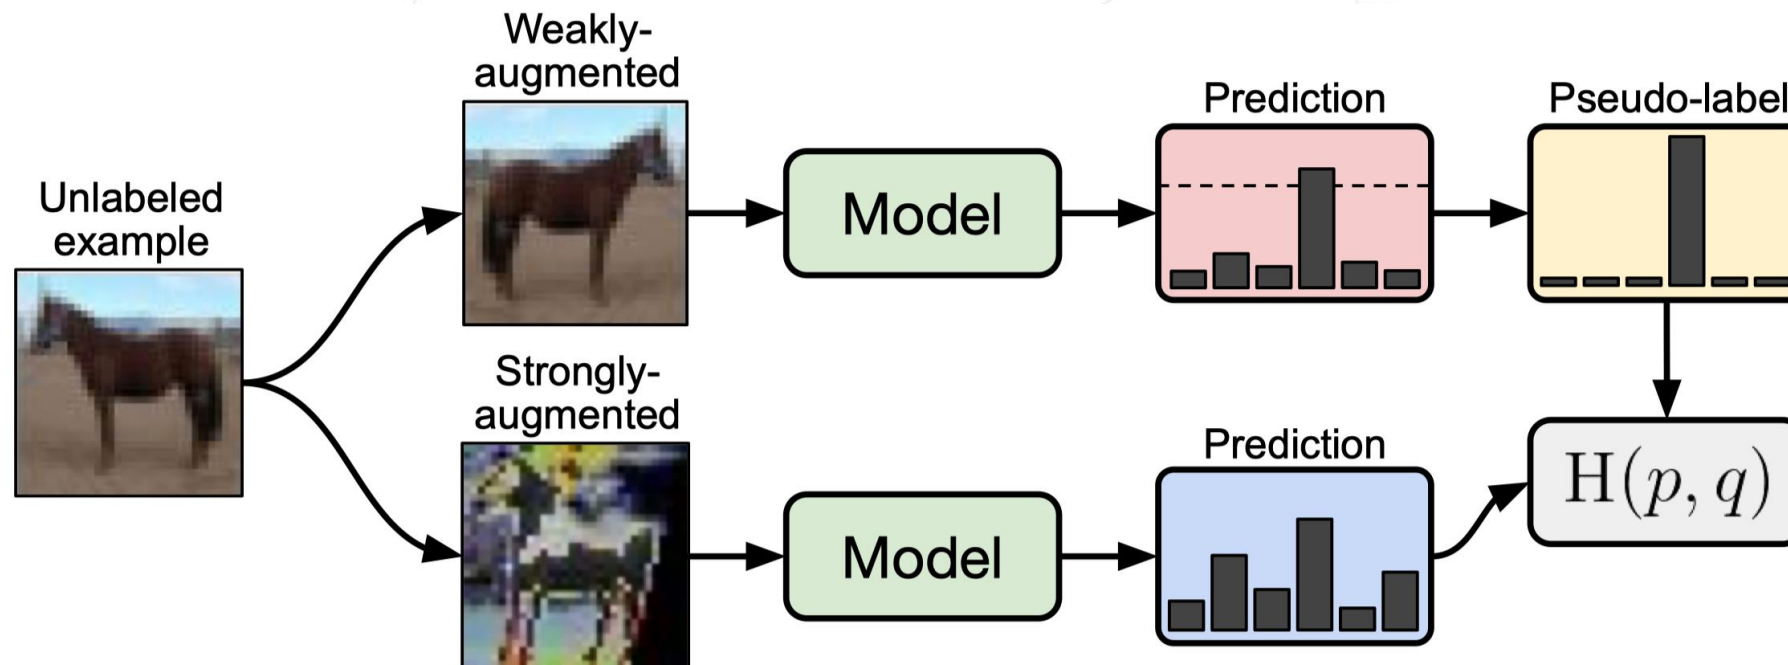

## • MixMatch: A Holistic Approach to Semi-Supervised Learning

- 1: **Input:** Batch of labeled examples and their one-hot labels  $\mathcal{X} = ((x_b, p_b); b \in (1, \dots, B))$ , batch of unlabeled examples  $\mathcal{U} = (u_b; b \in (1, \dots, B))$ , sharpening temperature  $T$ , number of augmentations  $K$ , Beta distribution parameter  $\alpha$  for MixUp.
- 2: **for**  $b = 1$  **to**  $B$  **do**
- 3:    $\hat{x}_b = \text{Augment}(x_b)$    *// Apply data augmentation to  $x_b$*
- 4:   **for**  $k = 1$  **to**  $K$  **do**
- 5:      $\hat{u}_{b,k} = \text{Augment}(u_b)$    *// Apply  $k^{\text{th}}$  round of data augmentation to  $u_b$*
- 6:   **end for**
- 7:    $\bar{q}_b = \frac{1}{K} \sum_k P_{\text{model}}(y | \hat{u}_{b,k}; \theta)$    *// Compute average predictions across all augmentations of  $u_b$*
- 8:    $q_b = \text{Sharpen}(\bar{q}_b, T)$    *// Apply temperature sharpening to the average prediction (see eq. (7))*
- 9: **end for**
- 10:  $\hat{\mathcal{X}} = ((\hat{x}_b, p_b); b \in (1, \dots, B))$    *// Augmented labeled examples and their labels*
- 11:  $\hat{\mathcal{U}} = ((\hat{u}_{b,k}, q_b); b \in (1, \dots, B), k \in (1, \dots, K))$    *// Augmented unlabeled examples, guessed labels*
- 12:  $\mathcal{W} = \text{Shuffle}(\text{Concat}(\hat{\mathcal{X}}, \hat{\mathcal{U}}))$    *// Combine and shuffle labeled and unlabeled data*
- 13:  $\mathcal{X}' = (\text{MixUp}(\hat{\mathcal{X}}_i, \mathcal{W}_i); i \in (1, \dots, |\hat{\mathcal{X}}|))$    *// Apply MixUp to labeled data and entries from  $\mathcal{W}$*
- 14:  $\mathcal{U}' = (\text{MixUp}(\hat{\mathcal{U}}_i, \mathcal{W}_{i+|\hat{\mathcal{X}}|}); i \in (1, \dots, |\hat{\mathcal{U}}|))$    *// Apply MixUp to unlabeled data and the rest of  $\mathcal{W}$*
- 15: **return**  $\mathcal{X}', \mathcal{U}'$

- ReMixMatch: Semi-Supervised Learning with Distribution Matching and Augmentation Anchoring
  - Improved version of MixMatch
  - Distribution Alignment (left) and Augmentation Anchor (right)

- FixMatch: Simplifying Semi-Supervised Learning with Consistency and Confidence
  - Combination of Consistency regularization and pseudo-labeling.

Sohn K, Berthelot D, et al. Fixmatch: Simplifying semi-supervised learning with consistency and confidence. arXiv preprint arXiv:2001.07685. 2020 Jan 21.

- FixMatch: Simplifying Semi-Supervised Learning with Consistency and Confidence
  - FixMatch consists of two loss terms: a supervised loss  $\ell_s$  and an unsupervised loss  $\ell_u$
  - $\ell_s$  is the standard cross-entropy loss

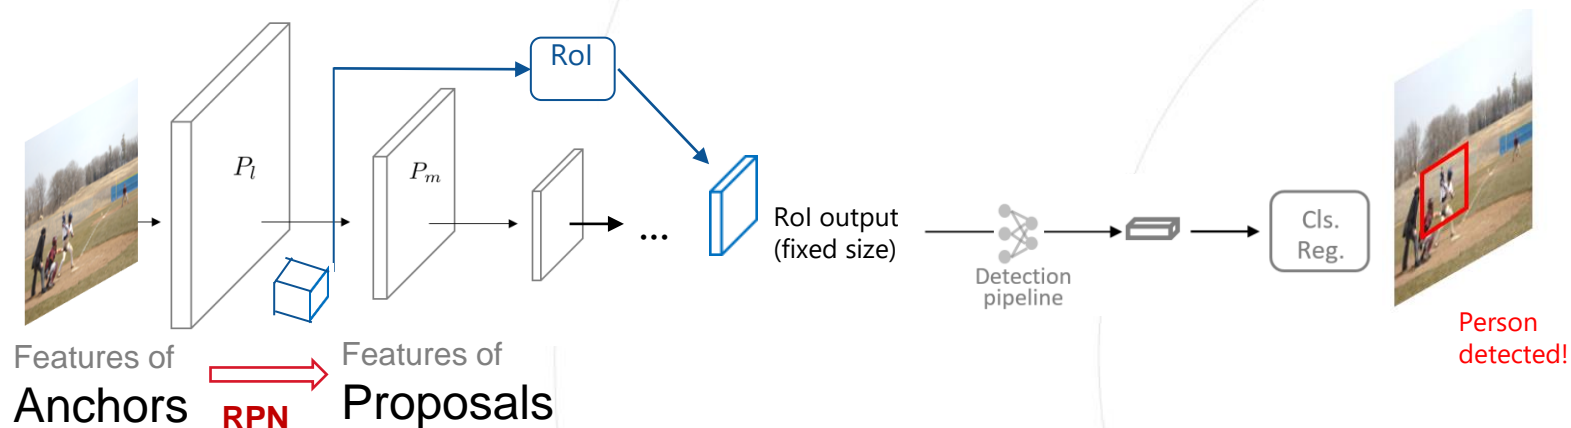

$$\ell_s = \frac{1}{B} \sum_{b=1}^B \text{H}(p_b, p_m(y | \alpha(x_b)))$$

- Convert the prediction on the weakly-augmented image to a one-hot pseudo-label
- $\ell_u$  is the cross-entropy loss against the model' s output for the strongly-augmented image

$$\ell_u = \frac{1}{\mu B} \sum_{b=1}^{\mu B} \mathbb{1}(\max(q_b) \geq \tau) \text{H}(\hat{q}_b, p_m(y | \mathcal{A}(u_b)))$$

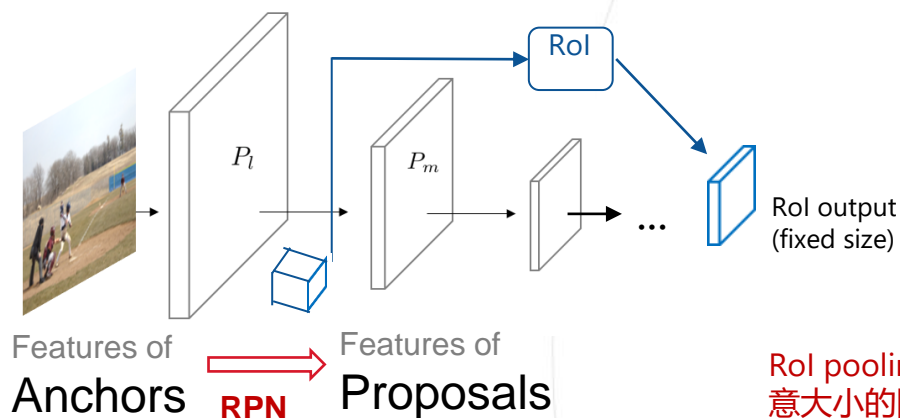

- **Two stage** vs One-stage pipeline

- Anchor placement: large anchors should be put in the low-level layers or high-level layers?

- **Two stage** vs One-stage pipeline

- Loss of RoI pooling

RoI pooling 的出现，让我们能用任意大小的图像作为输入，总能产生固定大小的输出。

$$\frac{\partial L}{\partial x_i} = \sum_r \sum_j [i = i^*(r, j)] \frac{\partial L}{\partial y_{rj}}. \quad (4)$$

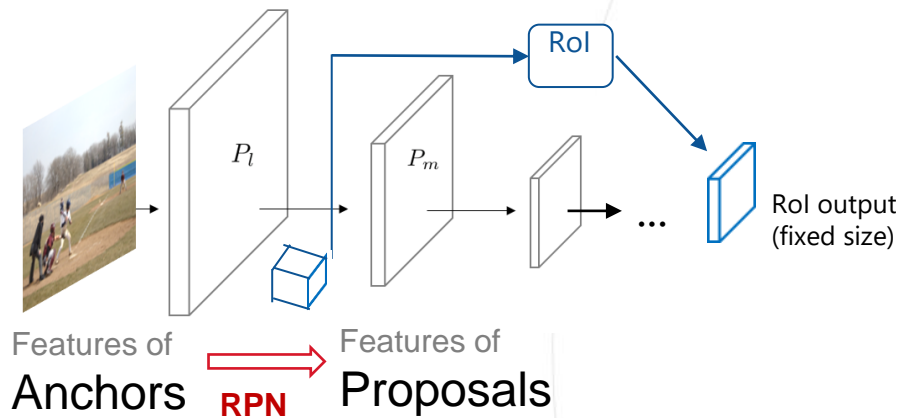

In words, for each mini-batch RoI  $r$  and for each pooling output unit  $y_{rj}$ , the partial derivative  $\partial L / \partial y_{rj}$  is accumulated if  $i$  is the argmax selected for  $y_{rj}$  by max pooling. In back-propagation, the partial derivatives  $\partial L / \partial y_{rj}$  are already computed by the backwards function of the layer on top of the RoI pooling layer.

RoI layer的BP计算。  
详见Fast RCNN paper.

- **Two stage** vs One-stage pipeline

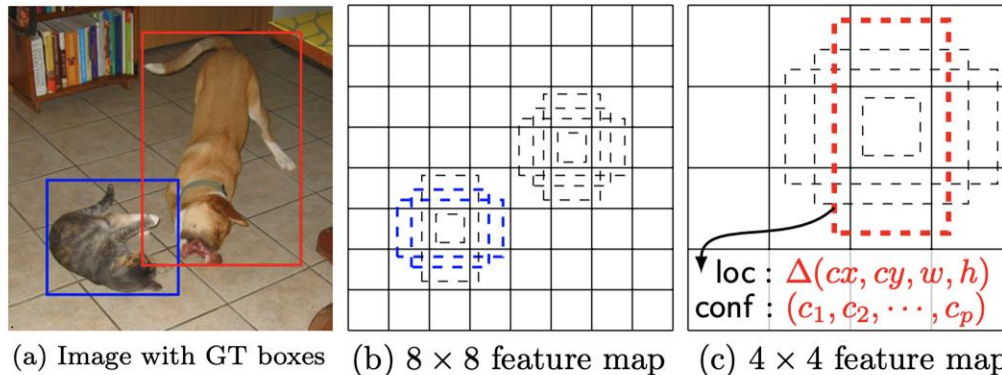

- Loss of RoI pooling

**Figure 3. RoIAlign:** The dashed grid represents a feature map, the solid lines an RoI (with  $2 \times 2$  bins in this example), and the dots the 4 sampling points in each bin. RoIAlign computes the value of each sampling point by bilinear interpolation from the nearby grid points on the feature map. No quantization is performed on any coordinates involved in the RoI, its bins, or the sampling points.

- Two stage vs **One-stage pipeline**

- No RPN, No RoI-pooling

What's the output feature map in this (c) example?

Answer:  $4 \times 4 \times (4 * 4 + p)$

Within **each grid cell**:

- Regress from each for the **B base boxes** (aka anchors) to a final box with **(dx, dy, dh, dw)**
- Predict scores for each of **p** classes

Fig. 1: **SSD framework**. (a) SSD only needs an input image and ground truth boxes for each object during training. In a convolutional fashion, we evaluate a small set (e.g. 4) of default boxes of different aspect ratios at each location in several feature maps with different scales (e.g.  $8 \times 8$  and  $4 \times 4$  in (b) and (c)). For each default box, we predict both the shape offsets and the confidences for all object categories  $((c_1, c_2, \dots, c_p))$ . At training time, we first match these default boxes to the ground truth boxes. For example, we have matched two default boxes with the cat and one with the dog, which are treated as positives and the rest as negatives. The model loss is a weighted sum between localization loss (e.g. Smooth L1 [6]) and confidence loss (e.g. Softmax).

- Detection loss

<https://arxiv.org/pdf/1506.01497.pdf>

$$L(\{p_i\}, \{t_i\}) = \frac{1}{N_{cls}} \sum_i L_{cls}(p_i, p_i^*) + \lambda \frac{1}{N_{reg}} \sum_i p_i^* L_{reg}(t_i, t_i^*)$$

$p^*$  and  $t^*$  are the ground truth for classification and localization/regression

- Note that regression loss is only for positive samples.

$$L_{reg}(t_i, t_i^*) = R(t_i - t_i^*)$$

$R$  is the smoothed L1 loss

(a) Image with GT boxes (b)  $8 \times 8$  feature map (c)  $4 \times 4$  feature map

Fig. 1: **SSD framework.** (a) SSD only needs an input image and ground truth boxes for each object during training. In a convolutional fashion, we evaluate a small set (e.g. 4) of default boxes of different aspect ratios at each location in several feature maps with different scales (e.g.  $8 \times 8$  and  $4 \times 4$  in (b) and (c)). For each default box, we predict both the shape offsets and the confidences for all object categories ( $(c_1, c_2, \dots, c_p)$ ). At training time, we first match these default boxes to the ground truth boxes. For example, we have matched two default boxes with the cat and one with the dog, which are treated as positives and the rest as negatives. The model loss is a weighted sum between localization loss (e.g. Smooth L1 [6]) and confidence loss (e.g. Softmax).

- Detection loss

<https://arxiv.org/pdf/1506.01497.pdf>

$$L(\{p_i\}, \{t_i\}) = \frac{1}{N_{cls}} \sum_i L_{cls}(p_i, p_i^*) + \lambda \frac{1}{N_{reg}} \sum_i p_i^* L_{reg}(t_i, t_i^*)$$

$p^*$  and  $t^*$  are the ground truth for classification and localization/regression

- Note that regression loss is only for positive samples.

$$L_{reg}(t_i, t_i^*) = R(t_i - t_i^*)$$

$R$  is the smoothed L1 loss

$$\text{smooth}_{L_1}(x) = \begin{cases} 0.5x^2 & \text{if } |x| < 1 \\ |x| - 0.5 & \text{otherwise,} \end{cases}$$

(a) Image with GT boxes (b)  $8 \times 8$  feature map (c)  $4 \times 4$  feature map

A bounding-box regression from **an anchor box** to a nearby **ground-truth box**.

$$\begin{aligned} t_x &= (x - x_a)/w_a, & t_y &= (y - y_a)/h_a, \\ t_w &= \log(w/w_a), & t_h &= \log(h/h_a), \\ t_x^* &= (x^* - x_a)/w_a, & t_y^* &= (y^* - y_a)/h_a, \\ t_w^* &= \log(w^*/w_a), & t_h^* &= \log(h^*/h_a), \end{aligned}$$

## YOLO vs SSD

SSD:

- Smaller input size
- Faster FPS

SSD:

- More templates/anchors from various depth in the network
- Higher mAP

Fig. 2: A comparison between two single shot detection models: SSD and YOLO [5]. Our SSD model adds several feature layers to the end of a base network, which predict the offsets to default boxes of different scales and aspect ratios and their associated confidences. SSD with a  $300 \times 300$  input size significantly outperforms its  $448 \times 448$  YOLO counterpart in accuracy on VOC2007 test while also improving the speed.

- One-stage detector: open-sourced repos

SSD Demo

How to implement a **YOLO (v3)** object detector from scratch in PyTorch

<https://blog.paperspace.com/how-to-implement-a-yolo-object-detector-in-pytorch/>

**SSD, YOLO这些方法都是one-stage detector.  
没有RPN过程, 直接生成检测结果。**

- NMS

一种post-processing 方式。  
用在**所有**检测系统里。

物体检测的指标里，不允许出现多个重复的检测，即使这些结果和真值都比较近。

那么如何删除多余的检测结果呢？  
**Non-maximum suppression (NMS)**

做法：

把所有检测结果按照分值(conf. score)从高到底排序，保留最高分数的box，那么和它距离上最近的那个box，就没有必要保留了。

以此类推。

- NMS

按照类别来做的。

右图例子（检测人脸），

1-4分别是分数由高到低的4个目标框，假设1, 3被判为距离较近，2, 4距离很近，

**哪些框保留，哪些要删除？**

- NMS

NMS是按照**每一个类别**做的

[https://github.com/hli2020/feature\\_intertwiner/blob/master/lib/layers.py#L664](https://github.com/hli2020/feature_intertwiner/blob/master/lib/layers.py#L664)

3, 4 removed!

2D, 2.5D (depth est.) and 3D

## Semantic segmentation

- **FCN**
- SegNet
- Dilation
- DeconvNet
- ENet (速度快)
- **Deeplab V1 V2 V3**
- ParseNet
- RefineNet
- Large Kernel Matters

## Instance segmentation

- SDS
- DeepMask
- SharpMask
- MultiPathNet
- MNC
- **Mask-RCNN**

## 卷积 (Convolution)

**Class** `torch.nn.Conv2d(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias=True)`

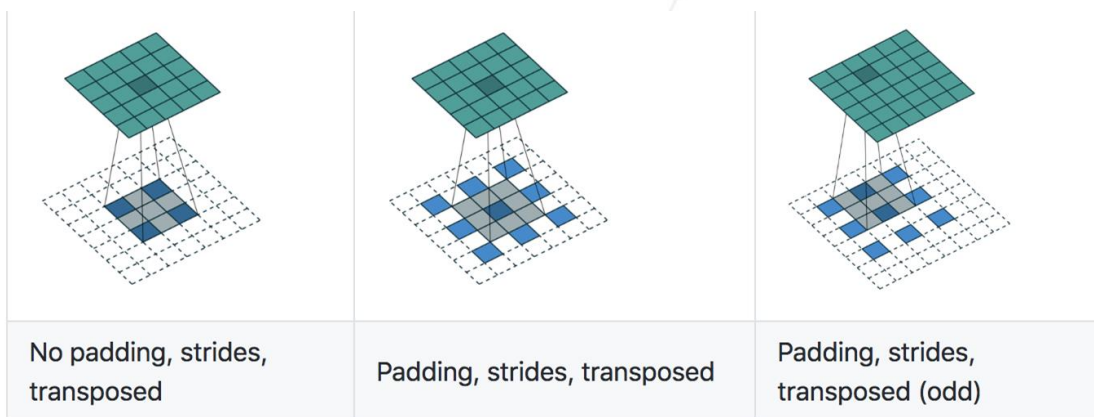

<https://pytorch.org/docs/stable/nn.html#torch.nn.Conv2d>

输出大小是多少?

Output size = 20, 33, 25, 50

公式:  $(W - \text{kernel} + 2 \text{ pad}) / \text{stride} + 1$  向下取整

## 反卷积 (Deconvolution) - upsample

蓝色的是输入feature map (较小), 绿色的是输出 (较大)

有stride 版本的反卷积是  
先 **up-sample**输入(蓝色), 然后移动filter, 正常卷积, 得出结果

普通卷积

$$W_{out} = (W - kernel + 2 pad) / stride + 1$$

反函数

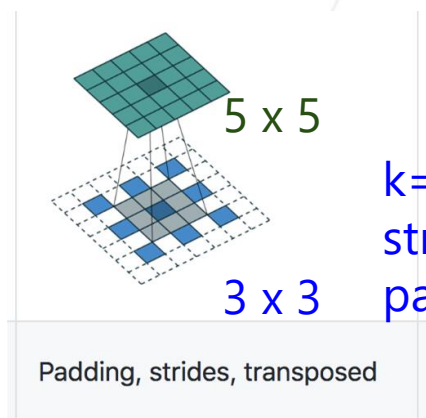

$$W = (W_{out} - 1) * stride - 2pad + kernel$$

反卷积公式

$$W_{out} = (W_{in} - 1) * stride - 2pad + kernel$$

## 反卷积 (Deconvolution) - upsample

k=3, 问padding  
和 stride是多少?

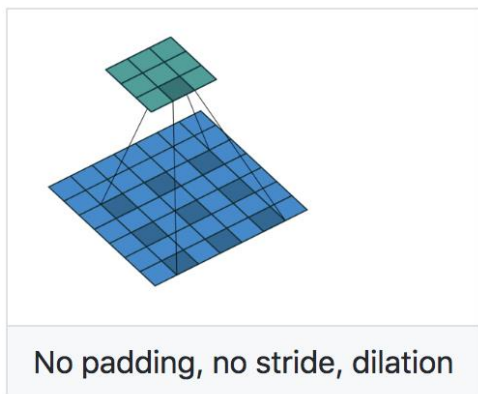

k=3,  
stride=2,  
pad=1

$$W_{out} = (W_{in} - 1) * stride - 2pad + kernel$$

**Class torch.nn.ConvTranspose2d (*in\_channels*,  
*out\_channels*, *kernel\_size*, *stride*=1, *padding*=0,  
*output\_padding*=0, *groups*=1, *bias*=True, *dilation*=1)**

## 空洞卷积 (Dilated convolution) - 正常卷积(downsample)的一个细节

• Input:  $(N, C_{in}, H_{in}, W_{in})$

• Output:  $(N, C_{out}, H_{out}, W_{out})$  where **默认值1, 即没有dilation**

$$H_{out} = \left\lfloor \frac{H_{in} + 2 \times \text{padding}[0] - \text{dilation}[0] \times (\text{kernel\_size}[0] - 1) - 1}{\text{stride}[0]} + 1 \right\rfloor$$
$$W_{out} = \left\lfloor \frac{W_{in} + 2 \times \text{padding}[1] - \text{dilation}[1] \times (\text{kernel\_size}[1] - 1) - 1}{\text{stride}[1]} + 1 \right\rfloor$$

**稀疏化filter** - 扩大视野(receptive field)

注意: 和反卷积不同!

应用一堆卷积，保持feature map和原始图片一致。(channel=D)  
最后一层卷积的channel个数是类别个数即可。(channel=C)

**但很显然，计算量较大**

This work is quite like the milestone of RCNN in detection

1. 训练问题：端到端学习
2. 连接层问题：全连接改为全卷积，支持可变输入
3. 特征图变小问题：利用反卷积向上放大特征图
4. 特征融合问题：利用skip connection融合多层特征提高上采样精细度

假设K+1类, 下标从0到k。  $p_{ij}$  表示属于 i 类的样本被预测为 j 类。

Pixel Accuracy(PA) = (预测对的像素个数)/(总的像素个数)

$$PA = \frac{\sum_{i=0}^k p_{ii}}{\sum_{i=0}^k \sum_{j=0}^k p_{ij}}$$

Mean Pixel Accuracy(MPA)= 平均每类的准确率

$$MPA = \frac{1}{k+1} \sum_{i=0}^k \frac{p_{ii}}{\sum_{j=0}^k p_{ij}}$$

Mean IoU=平均每类的IOU  $MIoU = \frac{1}{k+1} \sum_{i=0}^k \frac{p_{ii}}{\sum_{j=0}^k p_{ij} + \sum_{j=0}^k p_{ji} - p_{ii}}$

Frequency weighted IoU=加权后每类的IOU

$$FWIoU = \frac{1}{\sum_{i=0}^k \sum_{j=0}^k p_{ij}} \sum_{i=0}^k \frac{\sum_{j=0}^k p_{ij} p_{ii}}{\sum_{j=0}^k p_{ij} + \sum_{j=0}^k p_{ji} - p_{ii}}$$

# Outline

**Part 1**      **Recap: classification loss and detection pipeline**

---

**Part 2**      **Image segmentation**

---

**Part 3**      **Nextup: Building up your research career**

---

- What we are familiar with: classification, detection, segmentation
- Other vision tasks: Tracking/pose estimation/video understanding/captioning
- We will leave this part in the *later* session of the course.

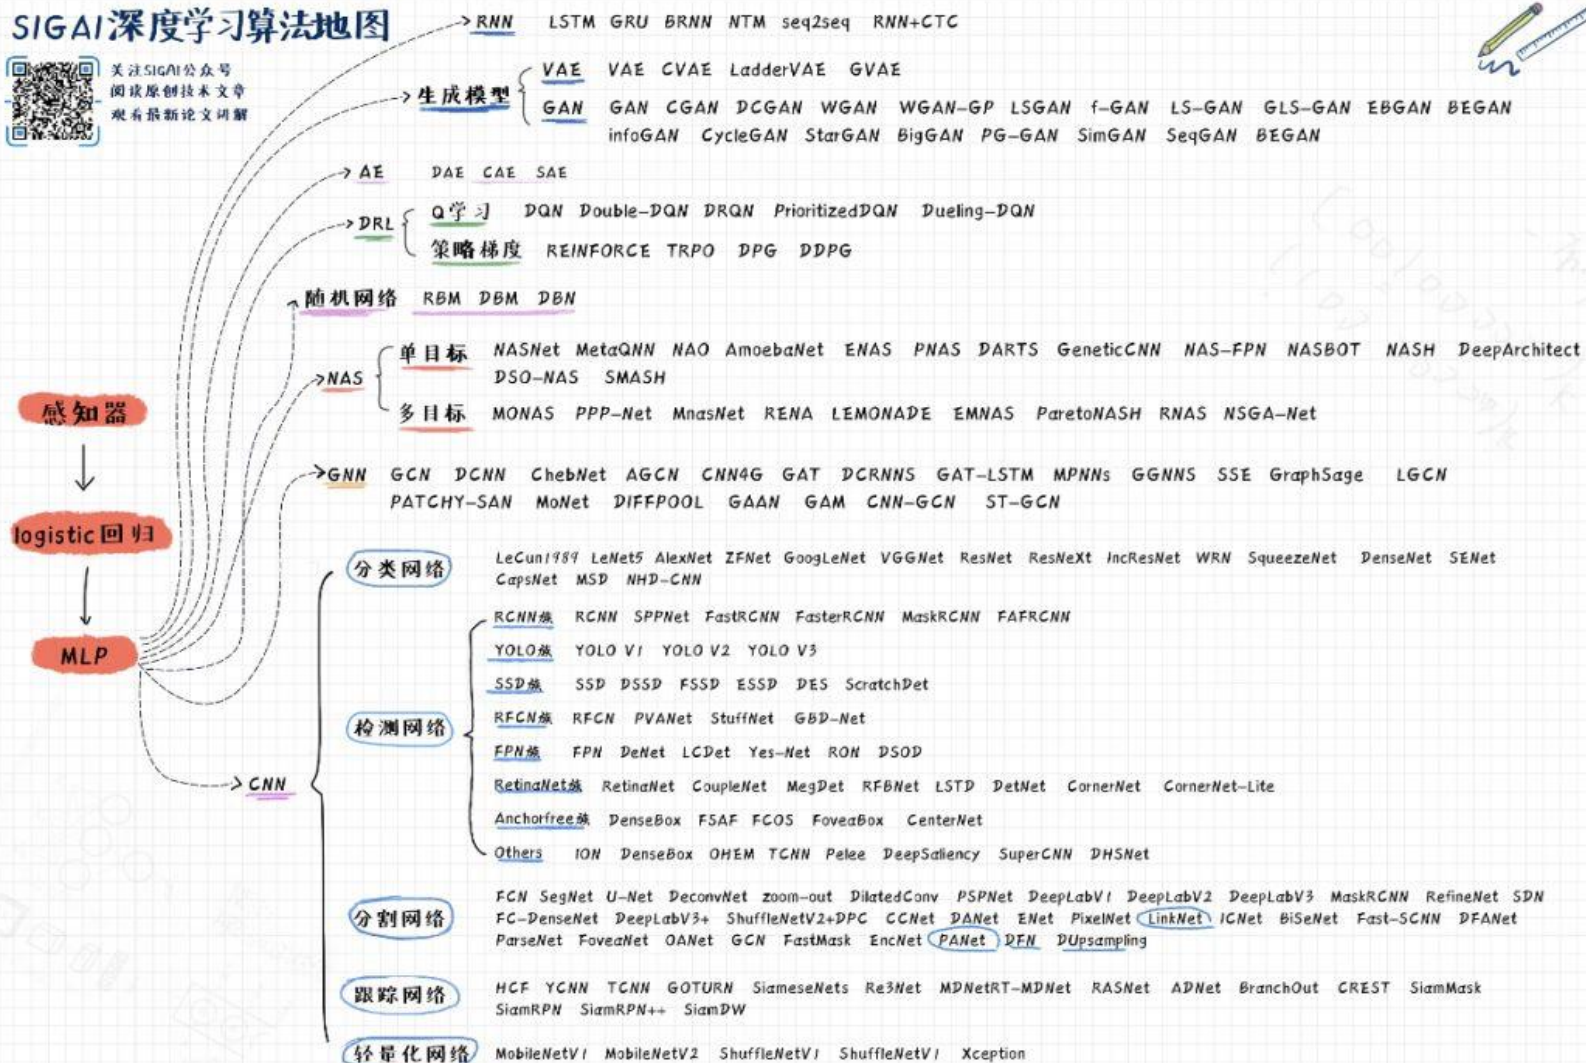

# Deep Learning Algorithms: a roadmap

## SIGAI深度学习算法地图

关注SIGAI公众号

观看最新论文讲解

- First period
  - **Main topic: 3D computer vision (25 min)**
  - Sum-up: High-level vision tasks (10 min)
  - Philosophy (10 min)
- Second period
  - Quiz 2 (45 min)
    - Probably 3-4 questions
    - Cross-entropy loss/ gradient computation
    - RoI-pooling/corner pooling/etc. computation
    - One question on hands-on practice
    - Open research question/others

- How to select research topics?
  - Impactful research
- How to judge the value/contribution of a paper?
  - Solid experiments
  - Issue-driven motivation
  - Other properties
- How to contribute contributions? ideas/novelty
  - How to come up with ideas
- Right ways to conduct a full-round research project
  - Choose topic, paper survey, build baseline, run experiments/formulate idea, write paper, rebuttal, camera-ready, poster/oral session, blog/open-source repo
- Academia vs industry

## Acquisition of Localization Confidence for Accurate Object Detection

<https://arxiv.org/pdf/1807.11590.pdf>

黄色是真值，红色和绿色是预测结果

根据NMS，和confidence score，选择红的还是黄的？ (hint: 关注cls conf 和IoU)

这样做会有什么问题？

Loc\_conf 是本文提出的NMS阶段应该参考的排序

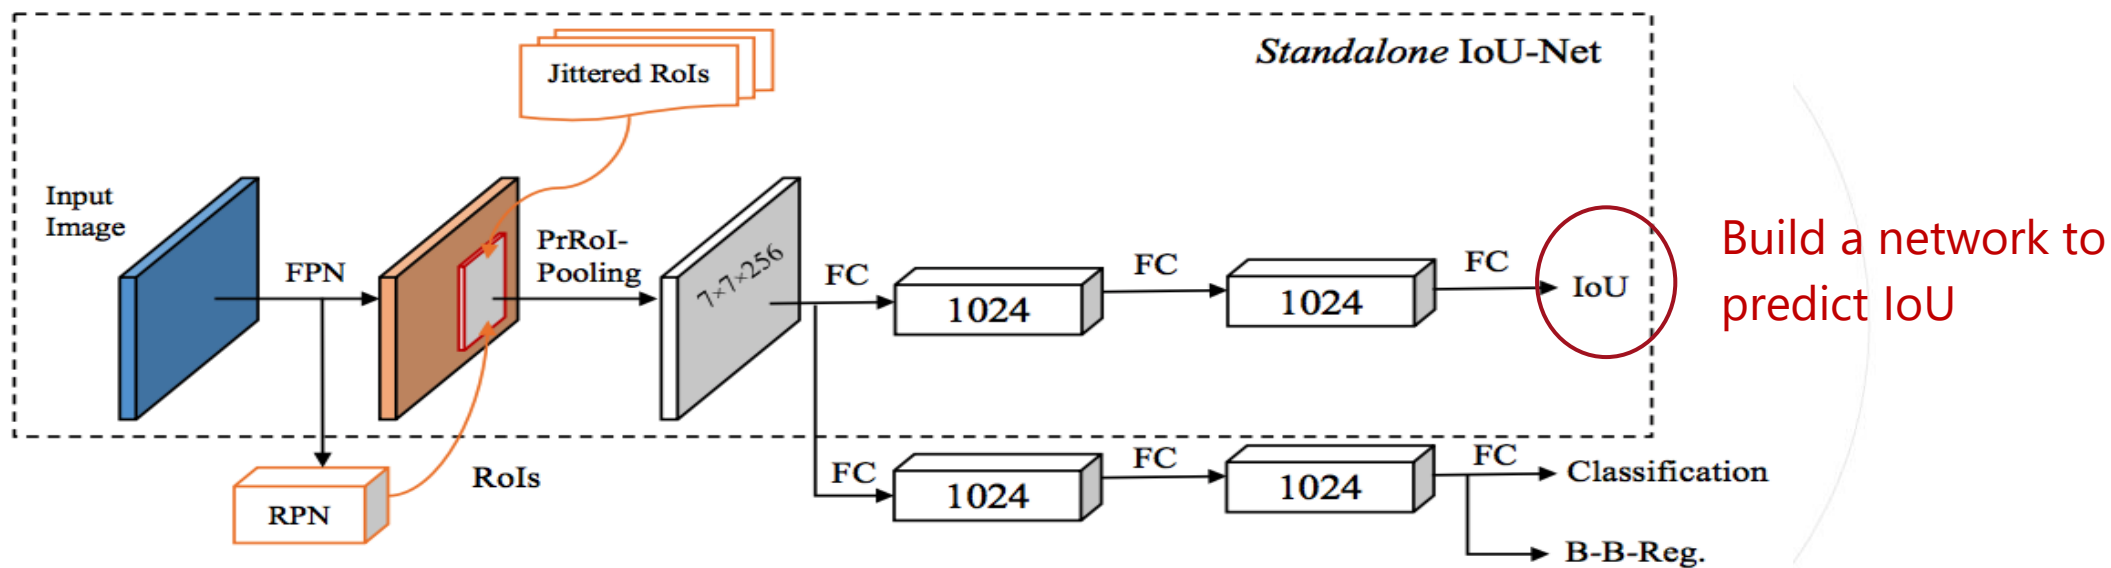

## Acquisition of Localization Confidence for Accurate Object Detection

<https://arxiv.org/pdf/1807.11590.pdf>

Misaligned classification and localization accuracy

—> How to solve it? Build a network to predict IoU! —> IoU-guided NMS

**Why?** since the mAP is measured by IOU!!!

清华大学  
Tsinghua University

**END**
